

High Income Tax Returns for 1984

By Allen H. Lerman*

Each year, a small number of individual income tax returns report income of \$200,000 or more but do not show any income tax liability. Although such returns represent only a tiny fraction of all Federal income tax returns with high incomes, they generate a great deal of interest. Interest focuses on the features of the income tax system that seem to permit some high-income people to completely avoid Federal income tax at the same time that other taxpayers, most of whom have much lower incomes, have tax liabilities amounting to significant shares of their incomes. Information on the reasons for nontaxability may provide a basis for discussing whether such features are necessary and appropriate in a broad-based income tax system.

Two different income concepts are used in determining whether a tax return falls into the high-income category. For 1984, each of these definitions shows a different pattern of change from 1983. As measured by "adjusted gross income" (AGI), the number of nontaxable, high-income returns increased for 1984. As measured by "expanded income," nontaxable, high-income returns declined significantly. No reasons are offered in this article for these different patterns.

The number of nontaxable, high "adjusted gross income" returns increased for 1984, continuing the dramatic rise which occurred for 1983. By this income measure, nontaxable, high-income returns as a share of all high-income returns reached a level not seen since before the enactment of the Tax Reform Act of 1976. For 1984, 471 high-AGI returns (out of a total of 243,760 high-AGI returns) had no tax liability either to the United States or to a foreign government, an increase of 47 percent from the 1983 level. From 1983 to 1984, the proportion of high-AGI returns which were nontaxable increased by 19 percent from 0.162 percent to 0.193 percent of all high-AGI returns.

However, the "expanded income" definition of income — the one deemed to be a "better" definition of income — indicates that the number of nontaxable, high-income returns declined significantly for 1984 both in absolute numbers and as a proportion of all high expanded-income returns. By this measure, the share of nontaxable, high-income returns returned to about the level typical of the period from 1977 through 1982. As measured by expanded income, the number of high-income returns not showing any income tax liability to either the United States or a foreign government decreased by 38 percent, from 437 for

1983 to 271 for 1984 (out of a total of 310,042 high expanded-income returns for 1984). From 1983 to 1984, the proportion of high-income returns that was nontaxable fell by one-half from 0.175 percent to 0.087 percent of all high expanded-income returns.

The Tax Reform Act of 1976 required annual publication of data on individuals with high incomes including the number of such individuals who did not pay any income tax and the importance of various tax provisions in making those individuals nontaxable [1]. The 1976 Act specified that the tax return data be tabulated using four different concepts of income [2]. The Deficit Reduction Act of 1984 eliminated the requirement for publishing data for the two lesser-used income concepts [3].

This article is part of a continuing series of reports summarizing the characteristics of high-income returns and the numbers of nontaxable, high-income returns since 1974. Reports covering 1974 through 1976, including the basic data and analyses of their implications, have been published by the U.S. Department of the Treasury's Office of Tax Analysis [4]. To make high-income data available to a wider audience, since 1979 selected data for high-income individuals, taxable as well as nontaxable, have been published, without analysis, by the Internal Revenue Service in separate chapters of each year's *Statistics of Income—Individual Income Tax Returns* [5]. Data for 1983, including a discussion of the data and of the implications of certain changes, have been published in a previous issue of the SOI Bulletin [6]. The basic data for 1984 which are included in Tables 1 through 12 and the material included in the appendices have been published previously in the *Statistics of Income* volume for 1984 [7].

This article consists of brief descriptions of twelve tables of data mainly from high-income tax returns for 1984. It also includes selected observations about the 1984 data, and a summary of how the numbers of high-income returns and, especially, nontaxable, high-income returns have changed since 1977. At the end of the article are two appendices which include outlines of the definitions and concepts which are crucial to an understanding of high-income tax returns in general and nontaxable, high-income returns in particular. Appendix A, "Income Concepts: A Primer," describes and explains the differences between the two major and two minor concepts used to measure income. Appendix B, "Measurement of Taxes," discusses the proper measure-

*Office of Tax Analysis, U.S. Department of the Treasury.

ment of income tax burdens, explains the different treatment of the foreign tax credit, outlines the methodology used to equate the importance of exclusions and deductions as compared with tax credits, and reviews certain limitations in the data underlying this article.

This article includes twelve basic tables with data representing 1984 income tax returns, mainly those with incomes of \$200,000 or more under one or more concepts of income. For comparability with data for earlier years, some of the data are shown for all four income concepts, including the two no longer required by statute. Most of the data are shown for taxable and nontaxable returns both separately and combined.

The tables show:

- The numbers of total and high-income returns (taxable, nontaxable, and combined) under each of the four income concepts (Tables 1 and 2);
- The distributions of taxable income as a percentage of total income (Tables 3 and 4);
- The frequencies and amounts of various sources of income, exclusions, deductions, taxes, and tax credits, as well as the relationships among all four income concepts used in this article (Tables 5 and 6);
- The frequencies with which various deductions and tax credits are the most important and second most important items in reducing (or eliminating) income taxes (Tables 7 and 8);
- The frequencies with which various itemized deductions and tax credits occur as certain percentages of income (Tables 9 and 10); and
- The distributions of effective tax rates, i.e., income tax as a percentage of income (Tables 11 and 12).

In addition to the data on high-income returns, the tables distribute all 1984 returns by broad income classes and cross-tabulate numbers of returns in each income class by the various income concepts. For purposes of comparison, the tables with distributions of returns by their effective tax rates include distributions for returns other than high-income returns.

Tables 1, 3, 5, 7, 9, and 11 contain data with foreign tax credits treated as items which reduce U.S. income taxes; this is the treatment on tax returns. Tables 2, 4, 6, 8, 10, and 12 are similar to the first set of tables but treat foreign tax credits as part of the individual's income tax liability. In these tables, tax is referred to as "modified total income tax." This different treatment is explained in more detail under the heading "Foreign Tax Credits" in Appendix B.

The article also includes five text tables (Figures A, B, C, D, and I) and four charts (Figures E through H) which either summarize the frequency of total or nontaxable, high-income returns over time, from 1977 through 1984, or show the changes between 1983 and 1984.

NUMBERS OF HIGH-INCOME TAX RETURNS

For 1984, the numbers of tax returns with incomes of at least \$200,000 ranged from 229,809 to 325,269, depending on the income concept. These numbers represent from 0.23 percent to 0.31 percent of all tax returns filed (Tables 1 and 2).

Over time, the number of returns with incomes of \$200,000 or more has been increasing more rapidly than the total number of returns. This pattern is true regardless of income concept. Thus, each year high-income returns have been a larger share of all returns than in the preceding years (Figure A). For each of the four income concepts, the share of returns with incomes of at least \$200,000 more than quadrupled from 1977 to 1984. For example, for 1977, there were under 68 thousand high expanded-income re-

Expanded income	.076	.095	.132	.160	.182	.217	.259	.312
AGI plus excluded preferences	.080	.101	.140	.169	.194	.231	.272	.327
AGI less investment interest	.057	.072	.095	.116	.133	.167	.194	.231

turns, representing 0.076 percent of all returns filed. By 1984, there were more than 310 thousand such returns, representing 0.312 percent of all returns. Between 1977 and 1984, as real incomes (income adjusted for inflation) increased and as inflation raised the number of people with higher money incomes, the number of income tax returns showing incomes of at least \$200,000 grew at an annual rate of more than 22 percent compared with an average annual increase of under 1.7 percent for the total number of income tax returns filed (Figure B).

NONTAXABLE, HIGH-INCOME RETURNS

For 1984, there were 310,042 income tax returns with expanded income of \$200,000 or more. Of these, 325 or 0.105 percent, had no U.S. income tax liability, and only 271, or 0.087 percent, showed no worldwide income tax liability (Figure C). If U.S. tax liability on worldwide income is considered, these 1984 levels represent a 44 percent decline in the number and a 55 percent decline in the share of nontaxable, high expanded-income returns from 1983 (Fig-

High-Income Returns, 1984

ure D). The share of 1984 nontaxable returns is lower than any year except 1983. The pattern of change is similar if worldwide tax liability on worldwide income is used as the yardstick. The number of nontaxable returns declined by 37 percent between 1983 and 1984, and the share of nontaxable returns declined by 50 percent to a level only slightly higher than the years before 1983.

Of the 243,760 tax returns for 1984 with AGI of \$200,000 or more, 532 or 0.218 percent, reported no U.S. income tax, and 471, or 0.193 percent, had no worldwide tax liability (Figure C). These numbers for nontaxable, high-AGI returns represent a significantly different pattern of change than that shown for nontaxable, high expanded-income returns. If only U.S. tax liability is considered, the number of nontaxable, high-AGI returns increased by 19 percent from their 1983 level to a new post-1976 high (Figure D). Their share of all returns declined by a modest 3 percent, remaining very close to their post-1976 peak. If worldwide tax liability is considered, both the number and percentage of nontaxable, high-AGI returns reached new highs. The number of returns increased by 47 percent to 471; the share of nontaxable returns reached 0.193 percent or almost one out of every 500 high-income returns. A high-AGI return was 6.4 times more likely to be nontaxable for 1984 than for 1979.

The patterns of year-to-year percentage change for the actual numbers of high-income returns for each income concept as measured by both U.S. and worldwide nontaxability are summarized in Figure D for each of the years 1978 through 1984. The 1984 data are unique in that the direction of change between AGI and expanded income is more markedly different than prior years.

Figures E through H illustrate how the numbers of nontaxable, high-income returns and their proportion of all high-income returns varied between 1977 and 1984. Figure E is for high-AGI returns with no U.S. tax. Figure F is for high expanded-income returns with no U.S. tax. Figure G is for high-AGI returns with no worldwide tax and Figure H is for high expanded-income returns with no worldwide tax.

For returns which were nontaxable in the United States as the result of foreign tax payments, the declines as percentages of all high-income returns were even larger, both from 1982 to 1983 and from 1983 to 1984. Thus, the fact that a high-income return was nontaxable for 1984 is far less likely to be attributable to the existence of a foreign tax credit than at anytime since 1977. By 1984, fewer than one out of six

FOREIGN INCOME TAX PAYMENTS

Data in Figure C can be used to calculate the numbers of nontaxable returns due primarily to foreign income tax payments, as evidenced by foreign tax credits shown on U.S. income tax returns. The results of these calculations which indicate the number of returns that would not have been nontaxable in the United States except for foreign tax payments are shown in Figure I. Between 1983 and 1984, the number of such returns actually declined by more than one-half, no matter which income concept is considered. This sharp decline followed a marked, but more modest, decline between 1982 and 1983.

nontaxable, high-income returns were nontaxable in the United States because the U.S. tax liability was wiped out by a foreign tax credit. This decline in the importance of the foreign tax credit in completely eliminating taxability does not seem to be the result of legislated change. At this point, the author cannot offer a reason for this apparently significant change.

DISTRIBUTION OF TAX LEVELS

Tables 3 and 4 show the distributions of high-income returns by the ratios of taxable income (as adjusted to reflect tax credits and special tax computations) to total income on the returns [8]. The tables illustrate three important facts

¹ Not computed.

about high-income tax returns. (The examples in the paragraphs below are drawn from the "expanded income" column in Table 4).

1. As already described, only a small proportion of high-income taxpayers were able to escape all income taxes (0.087 percent).
2. Another group of high-income taxpayers—still a small group but larger than the nontaxable group—was able to offset half or more of its income before being subject to tax. This type of high-income taxpayer pays income tax equal to only a small share of his or her income, perhaps a smaller share of income than that of a typical median-income family. Such taxpayers may be called "nearly nontaxables." (About 0.7 percent of high expanded-income taxpayers were able to reduce their taxable income to less than 25 percent of their expanded income.)

Legitimate questions can be raised about whether this nearly nontaxable group is paying its "fair share" of the aggregate income tax. Despite the small amount of tax payable by the nearly nontaxables, they have escaped the notoriety accorded to high-income tax returns which show absolutely no tax liability.

3. Overall, a large portion of high-income taxpayers were subject to tax on a large share of their income and reported very substantial amounts of tax. (About 27 percent had taxable income exceeding 80 percent of expanded income. Over 63 percent had taxable income of more than 50 percent of expanded income.)

Tables 11 and 12 represent another way of showing the distributions of tax returns by tax burden. These two tables classify all tax returns by both the size of income and the effective tax rate, i.e., income tax as a percentage of income.

1. These tables illustrate the distribution of effective tax rates for high-income returns as compared with the distribution for returns with lower income levels: under \$50,000; \$50,000 to \$100,000; and \$100,000 to \$200,000. On the average, high-income taxpayers do have higher effective tax rates.
2. The tables also illustrate the wide dispersion of effective tax rates for high-income returns. While 1.2 percent of high expanded-income returns showed either no worldwide tax liability or tax liability of less than 10 percent of expanded income, 1.0 percent had effective tax rates of 45 percent to 50 percent of income, and approximately 0.2 percent reportedly paid income tax equal to more than one-half of their expanded income. More than 91 percent had average tax rates ranging from 15 percent to 45 percent of

income, with over 55 percent of high-income taxpayers having effective tax rates between 20 percent and 40 percent of income (see Table 12).

CHARACTERISTICS OF TAX RETURNS

Tables 5 and 6 show, in the aggregate, the frequencies and amounts of the types of income; the items of tax preference; and the various deductions, credits, and income taxes shown on high-income returns. By comparing the columns for nontaxable returns with those for taxable returns, some of the different characteristics of nontaxable returns can be deduced. For example, the ratios of both partnership income to total income and partnership losses to total income were far higher on nontaxable returns.

REASONS FOR NONTAXABILITY

Tables 7 and 8 classify tax returns by the items that had the largest and second largest effects in reducing or eliminating income tax. For the returns on which each primary item was most important, the tables show the distributions of the second most important items. For example, on taxable returns with expanded incomes of at least \$200,000, the most important item in reducing the amount of tax reported on 44 percent of the returns was the itemized deduction of State and local taxes (Table 8). For returns on which taxes were the largest item, the itemized deduction for interest payments was the second most important item 42 percent of the time and charitable contributions were the second most important item 38 percent of the time. Conversely, on nontaxable returns (with no worldwide tax), the interest-paid deduction was the most important item 64 percent of the time. Where interest paid was the primary item, there was no secondary item 34 percent of the time and charitable contributions and the deduction for taxes paid were each the second most important item 24 percent of the time.

Tables 9 and 10 represent another way of illustrating the importance of various tax provisions in reducing or eliminating income tax. Unlike Tables 7 and 8, these tables show data only for nontaxable returns. For returns without any income tax, these tables show the number of times that various items reduced income by different fractions of income. The items shown are the various categories of itemized deductions, total tax preferences excluded from income, and the deduction equivalents of three different types of tax credits. For example, for high expanded-income returns with no worldwide tax, the itemized deduction for casualty losses exceeded 100 percent of expanded income on 16 of the 271 returns but there was no casualty loss deduction on 239 returns. The deduction equivalent of the investment credit was between 50 percent and 100 percent of expanded income on three returns, and the total interest-paid deduction exceeded total expanded income on 49 returns.

CONCLUSION

Tax return data for 1984 represent the impact of the third and final installment of the 23 percent overall reduction in tax rates enacted as part of the Economic Recovery Tax Act of 1981 (ERTA). Most of the structural changes included in ERTA — including a reduction in the maximum marginal tax rate to 50 percent and significant changes in the minimum and alternative minimum taxes — took effect before 1984 [9]. Thus, it is difficult to attribute the changes in nontaxable, high-income returns directly to ERTA. It is, however, possible, that the 1984 data represent a return to more nearly normal levels following abnormal, transitory effects due to anticipation of, and initial reaction to, the changes made by ERTA.

Even allowing for the fact that 1982 and 1983 data may have included some transitory changes due to the enactment of ERTA, the differing trends in nontaxable, high-AGI returns versus high expanded-income returns for 1984 remain somewhat puzzling. Nontaxable, high expanded-income returns as a share of all high expanded-income returns appear to be approximately in line with prior data for other than 1983. The higher absolute number of such returns can be attributed to the secular growth in the total number of high-income returns. However, this pattern for nontaxable, high expanded-income returns is not consistent with the continual, substantial growth of nontaxable, high-AGI returns.

NOTES AND REFERENCES

APPENDIX A

INCOME CONCEPTS: A PRIMER

This appendix explains the differences between the two major and two minor concepts of income which are used in this article. It outlines how the various concepts differ from the ideal economic concept of income. It reviews the two major conceptual differences between the income measures used, and it defines the exact relationships between the various concepts.

Economic Income, the Ideal Measure

Economists generally agree that for analyzing the impact of taxes, the ideal measure of income over a particular period of time, say a year, is the value of what the individual or family consumed over that period plus the change, if any, in its net worth [A1]. For example, if during a year a family spent \$10,000 and saved \$2,000, economists would say the family had an income of \$12,000. Similarly, if the family spent \$10,000 but owned an asset such as an automobile that decreased in value by \$1,000, economists would say that the family has an income of only \$9,000. A brief exami-

nation of the differences between income as defined by economists, often called economic income, and the adjusted gross income (AGI) concept, currently used for Federal income tax administration, illustrates some of the problems of measuring income, especially for high-income individuals.

Adjusted Gross Income

The concept of adjusted gross income was developed for tax administration. It was never meant to be an accurate measure of so-called economic income. Indeed, it is well recognized that AGI is deficient as a measure of economic income. For Tax Year 1984, AGI excluded certain types of income, such as interest from tax-exempt State and local Government bonds, most social security benefits, imputed rent on owner-occupied housing, and the value of many employee fringe benefits. Also, while not strictly excluded from AGI, income from other activities is deferred to a later year, or indefinitely, for income tax purposes. Depreciation deductions allowed for income tax purposes that exceed the decrease in the economic value of an asset often reduce AGI below economic income early in an asset's life. The resulting lower depreciation deductions in later years may raise AGI above economic income. The net effect, however, of accelerated depreciation is to postpone taxes, perhaps indefinitely [A2].

Adjusted gross income excludes most changes in net worth, such as the 60 percent of realized long-term capital gains that was excluded for 1984 and all accrued, but unrealized, capital gains [A3].

Even though some types of income are excluded, AGI may overstate economic income because some expenses incurred in the production of income are not deductible in the computation of AGI. Most of these expenses, however, are deductible from AGI in calculating taxable income, but only if the taxpayer "itemizes" deductions. Expenses falling into this category include certain expenses incurred by employees (such as union dues and expenditures for items used on-the-job but not reimbursed by the employer) and expenses attributable to a taxpayer's investments (as opposed to active operation of a trade or business), including, but not limited to, interest expense incurred in connection with investments in securities. Although net capital losses reduce economic income, only the first \$3,000 of net realized capital losses may be deducted in computing AGI. Any additional realized losses must be carried forward to future years. Moreover, for 1984, only 50 percent of realized, net long-term capital losses were deductible in computing AGI.

Redefining Income

Ideally, the impact of all taxes should be measured relative to economic income. However, no accurate, detailed data on such a broadly-defined income measure are availa-

ble from income tax returns (or from any other source) for a cross-section of American taxpayers. As a practical matter, any broad income measure must be calculated from data already available from Federal individual income tax returns. Thus, a more comprehensive income measure must start from AGI and, to the extent that data are available, must make adjustments for omitted income items and expenses that ought to be deductible in calculating economic income [A4].

Omitted Income and Accelerated Deductions

Tax returns contain information about only a portion of the income included in economic income but excluded from AGI. The omitted income that could be identified on 1984 income tax returns consisted of the excluded portion of long-term capital gains (and current-year losses in excess of currently deductible amounts), the dividend exclusion of up to \$100 per tax return (up to \$200 on joint returns), payments to self-employed retirement (Keogh) and Individual Retirement Arrangement (IRA) pension savings plans, and income from sources considered to be tax preferences for purposes of the alternative minimum tax. Even if no alternative minimum tax is due, such preferences are generally supposed to be reported on Form 6251, Alternative Minimum Tax Computation, which is supposed to accompany the person's income tax return [A5].

Even after including preference income which was not in AGI but which was identifiable on 1984 tax returns, several major sources of income for high-income taxpayers were still omitted:

- Interest on tax-exempt State and local Government bonds;
- All accrued but unrealized income, primarily unrealized capital gains;
- Certain agricultural expenses deducted when paid, even though related income items are not includable in income until a later year;
- Imputed rental income from owner-occupied housing and from consumer durables;
- Straight-line depreciation deductions on real estate to the extent that they exceeded economic depreciation;
- Income "sheltered" from taxation — primarily partnership income — through deferral of the recognition of income for tax purposes and/or the acceleration of deduction items; and
- The value of employee fringe benefits [A6].

For real estate, the combination of a shorter life for tax

purposes than the true economic life of the property and the use of accelerated depreciation methods may produce tax depreciation deductions exceeding economic depreciation, especially in the early years of ownership. Subsequently, income may be correspondingly higher, but in the meantime, the taxpayer has the interest-free use of the deferred taxes. Also, if taxed in the future, the income could be converted into a long-term capital gain, which through Tax Year 1987 would be taxed at a lower rate than ordinary income.

Conceptual differences between income subject to ordinary tax and income benefitting from tax-preferred treatment may also lead to some understatement of income. Because of tax benefits, individuals may be willing to accept lower rates of return on investments yielding tax-preferred income. If one views that reduction in potential income as an "implicit tax" on that income (paid in lieu of ordinary tax), then the reporting of fully taxable and tax-preferred income is not consistent. Fully taxable income is being reported on a pre-tax basis, whereas a tax-preferred income is being shown on an after-tax basis. See "Implicit Tax" in Appendix B for further discussion of this concept.

Because income sources not identifiable from tax return data were excluded, all income measures used in the data for this article may understate economic income. As a consequence, some individuals with high economic incomes may have been omitted completely from the high-income group covered by this report. Moreover, the income of some individuals who are included may have been understated, and tax as a percentage of income (i.e., the effective tax rate) may have been overstated.

Investment Expenses

In measuring economic income, it generally would be appropriate to deduct all expenses incurred in the production of income, including those related to any income-producing investments. Since economic income would include all investment income, including accrued capital gains and losses, it would be proper to deduct all investment expenses without limit. Investment expenses in excess of income would then represent net economic losses, roughly akin to "net operating losses" from a trade or business. However, such a liberal deduction for investment-related expenses is not necessarily correct when all income items have not been included currently.

If all income has not been included currently, full deduction of investment expenses might represent a mismatching of receipts and expenses and might result in *understating* income. For example, if a taxpayer borrowed funds to purchase securities, net income would be understated if the taxpayer deducted all interest payments on the loan but did not include as income any accrued gains on the securities. A similar mismatching of income and expenses would occur if investment expenses that should properly be capital-

ized were deducted when paid. In these instances, a more accurate measure of income might be obtained by postponing the deduction of the expense until such time as the income were recognized for tax purposes.

Additional problems are created when a person with a loan has both income-producing assets, such as securities, and non-income-producing assets, such as a vacation home or yacht. It is not possible to determine what portion of the interest expense should be attributed to taxable income-producing assets and, therefore, ought to be deductible against the gross receipts from such taxable assets.

As a result of these problems, it has been necessary to set arbitrary limits on the amount of investment expenses which are deductible in calculating a broader measure of income.

Investment expenses that have not been deducted in determining AGI generally appear on a Federal individual income tax return in two places. Investment interest appears as part of the itemized deduction for interest; other investment expenses such as management fees are included in the miscellaneous category of itemized deductions [A7]. To determine expenses that should be deductible in calculating an approximation of economic income, investment expenses have been *defined* as the entire interest deduction other than the interest paid on a home mortgage. Other investment expenses could not be determined since they could not be separated from the remainder of "miscellaneous" deductions. Hence, they have not been used in the adjustment for investment expenses.

To the extent that interest expenses do *not* exceed investment income, they have been allowed as a deduction in the computation of a broader measure of income. One consequence of this definition is that investment expenses can never turn positive investment income into investment losses. Generally, allowing investment expenses to offset all investment income is generous and tends to understate broadly-measured income. However, in some instances, limiting investment expenses to investment income may *overstate* income by disallowing genuine investment losses. This arbitrary procedure has been selected because, especially with the omission of accrued capital gains from measured income, allowing all investment expenses to be deducted would represent a mismatching of income and expenses.

The amount of investment income against which investment interest can be offset depends on the amount of investment income included in the income measure under consideration. Investment income consists of interest, dividends, and net capital gains (or losses). However, if only a portion of capital gains is included in the income concept, as is the case with AGI for 1984, then only that portion is considered to be investment income. A similar adjustment

was also made for the dividend exclusion of up to \$100 per tax return (\$200 on a joint return).

Expanded Income

The Congress has asked for high-income data to be tabulated on the basis of a measure closely approximating economic income but using only data available on tax returns. This measure is called "expanded income."

Expanded income is defined as adjusted gross income (AGI) *plus* items of tax preference income excluded from AGI *less* investment expenses to the extent that they do not exceed investment income [A8]. Tax preferences considered for 1984 were the \$100-per-tax-return exclusion for qualifying dividends (\$200 on a joint return), the excluded portion of net long-term capital gains, and, where the taxpayer filed a Form 6251, Alternative Minimum Tax Computation, all other excluded income preferences subject to the minimum tax [A9]. For individuals, the only preference income items of significance other than the excluded portion of capital gains are the excess of accelerated depreciation over straight-line depreciation on real property and on personal property subject to a lease, the excess of percentage depletion over the cost of the property, and deductions for intangible drilling costs in excess of the amounts deductible if these costs had been amortized. Because expanded income is based on tax return data, it excludes items such as interest on tax-exempt State and local Government bonds, accrued but unrealized capital gains, straight-line depreciation on real estate in excess of economic depreciation, most employee fringe benefits, and other items mentioned above, under "Omitted Income and Accelerated Deductions."

Four Income Measures

Current law requires high-income tax return data to be selected and classified on the basis of two different definitions of income: expanded income and adjusted gross income. For comparability with data for earlier years, this section also includes a limited amount of data using two other, previously required, income definitions. Each of the two additional income measures embodies only one of the two major differences between expanded income and AGI. "Adjusted gross income plus excluded tax preferences" is AGI *plus* the amount of tax preference income excluded from AGI. "Adjusted gross income less investment interest" is AGI *less* the amount of investment interest to the extent that it does not exceed investment income.

When ranked according to size of income, AGI plus excluded tax preferences is largest, AGI less investment interest is smallest, and AGI and expanded income fall in the middle. For any given taxpayer, AGI can be larger or smaller than expanded income depending on whether preferences are larger or smaller than investment interest.

The four income concepts are related in the following manner [A10]:

Expanded income

$$= \text{Adjusted gross income} + \text{preferences} \\ - \text{investment interest}$$

Adjusted gross income

$$= \text{Expanded income} - \text{preferences} \\ + \text{investment interest}$$

Adjusted gross income plus excluded tax preferences

$$= \text{Adjusted gross income} + \text{preferences}$$

$$\text{or} = \text{Expanded income} + \text{investment interest}$$

Adjusted gross income less investment interest

$$= \text{Adjusted gross income} - \text{investment interest}$$

$$\text{or} = \text{Expanded income} - \text{preferences}$$

Expanded income is the measure which most closely approximates economic income.

NOTES TO APPENDIX A

[A1] This is the Haig-Simons definition of income.

[A2] For Tax Year 1984, the Internal Revenue Code defined adjusted gross income as all gross income not specifically excluded or reduced by statutory adjustments. Among the exclusions were trade or business deductions (including some deductions by employees) and depreciation deductions allowable for tax purposes, the deduction for 60 percent of net long-term capital gains, limited deductions for losses from the sale or exchange of property, deductions attributable to rents and royalty income, the moving expenses adjustment, and deductions for contributions to individual retirement arrangements (IRA's) and self-employed retirement (Keogh) plans.

[A3] Gross income includes only income that has been "realized." Thus, for Federal income tax purposes, accrued increases or decreases in the value of assets are generally not included in income until any gain or loss is realized by a sale or exchange. In addition, gross income does not include the value of the services received from the use of durable goods, such as imputed net rent from owner-occupied homes or from consumer durables. Finally, gross income and, hence, adjusted gross income, do not include interest on most types of State and local Government debt, most social security benefits, workers' compensation benefits, and most types of welfare benefits.

[A4] There have been attempts to create microdata files that include approximations of economic income. Tax return data files have been "statistically merged", i.e., merged with information for persons having similar characteristics, with other files such as the Current Population Survey (CPS) of the Bureau of the Census. After the merge, certain additional data items that were not on either file have been "imputed" to each record of the merged file. Although such statistically-merged files have proven useful for many purposes, they have only limited use—and must be used with great caution—for high-income individuals and families, each of which is likely to have more unique financial and income characteristics that are not likely to be duplicated accurately through imputations and statistical merges.

[A5] The tax preferences excluded from adjusted gross income, as tabulated in Tables 5 and 6, included the following items: the dividend exclusion; the "all-savers" interest exclusion; the excluded portion of long-term capital gains; the excess of accelerated depreciation over straight-line depreciation on certain real property and property subject to a lease; the excess of rapid amortization allowable on certain capital expenditures (such as pollution control facilities) over depreciation otherwise allowable; the excess of percentage depletion over the "adjusted basis" of the property; unrealized gain on the exercise of stock options; and certain intangible drilling costs to the extent that they exceeded the otherwise allowable amortization deduction. Any preferences from itemized deductions did not represent omitted income; hence, they were not counted as preference items in calculating a broader measure of income.

[A6] Omission of social security benefits and certain other items is relatively unimportant for high-income taxpayers.

[A7] In addition, income deferrals and accelerated expense deductions may also be involved in income or losses from rental property, from royalties, from partnerships, and from certain small business corporations, only the net amounts of which are included in adjusted gross income.

[A8] For the sake of brevity, "investment interest to the extent that it does not exceed investment income" is called "investment interest." "Investment interest in excess of investment income" is called "excess investment interest."

[A9] See footnote [A5].

[A10] The borderline between excess and non-excess investment interest depends on the income items actu-

ally included under each income concept. Hence, the investment interest adjustment differs depending on which income definition is used.

APPENDIX B

MEASUREMENT OF TAXES

This appendix discusses the proper measurement of income tax borders. It explains two different treatments of the foreign tax credit: as a tax on income; or as an item of tax preference. It discusses the concept of implicit tax on tax preference income. It outlines the methodology which was used in the development of the basic tabulations of 1984 tax return data to equate the importance of exclusions and deductions from the income base subject to tax with tax credits. Finally, certain limitations in the underlying tax return data are summarized.

Foreign Tax Credits: Worldwide Taxes on Worldwide Income

Just as income must be measured properly, so must income taxes.

U.S. income taxes are based on global (worldwide) income. Thus, U.S. citizens and residents generally must include income on their U.S. income tax returns regardless of whether it has been generated in the United States or in a foreign country. However, when a taxpayer has foreign source income, the U.S. income tax computed on global income may often be reduced dollar-for-dollar by the amount of foreign income taxes that has been paid on that foreign income. These offsets for foreign income taxes are called "foreign tax credits" [B1].

Statistics of Income (SOI) data collected as a by-product of tax administration include global income as reported on U.S. income tax returns. The SOI data, however, usually include as taxes only U.S. income taxes net of the foreign tax credits that represent offsets for foreign income tax payments. Where taxpayers have income from foreign sources, this procedure understates their worldwide tax liabilities and their effective tax rates. Since worldwide income is reported on U.S. tax returns, a more accurate measure of the tax burden imposed on that income would be obtained if all income taxes—U.S. as well as foreign—were considered. Analysis of high-income tax returns indicates that a substantial portion of the so-called nontaxable, high-incomes have large shares of their income from non-U.S. sources and have paid substantial amounts of foreign income taxes on that income. Thus, it does not seem appropriate to classify these individuals as nontaxable or to classify their foreign tax credits as special tax benefits.

In order to present a more realistic picture of the number of nontaxable, high-income tax returns and the reasons

they were nontaxable, several tables in this article have been prepared by redefining income tax liability to consist of the total amount of U.S. income taxes (income taxes after credits plus the alternative minimum tax) plus the amount of foreign tax credits. Because information on foreign tax liabilities is not readily available in tabulations from U.S. income tax returns, foreign tax credits as shown on U.S. income tax returns were selected as a proxy for foreign tax liabilities. Where foreign tax rates exceed U.S. rates, and in certain other instances, foreign tax credits actually will be less than foreign tax liabilities. In such cases, using foreign tax credits as a proxy for foreign taxes understates global income tax liability. In cases in which foreign tax credits are for taxes paid on income from earlier years, use of foreign tax credits may either overstate or understate global taxes on the current year's income.

Tables redefining tax liability to include the foreign tax credit attempt to present an approximation of the true worldwide (global) income tax burden on worldwide income. For the vast majority of taxpayers—with high incomes or otherwise—this adjustment is irrelevant, for they have little or no foreign-source income. However, for the small proportion of taxpayers with substantial foreign income, this adjustment is important. The policy implications of a person with a very large amount of income not paying U.S. income tax certainly would be different if U.S. nontaxability were the result of the person's living and working abroad and paying substantial amounts of foreign tax than if all income were from U.S. sources and the person paid no income tax to either the U.S. Government or any other government.

In order to be consistent with data from earlier years, all tables showing nontaxability or the amount of taxability on the basis of worldwide tax liability have been duplicated by other tables with tax liability defined in the more traditional way used for tax administration purposes: U.S. income tax liability after subtracting the value of any foreign tax credits. Tables 1, 3, 5, 7, 9, and 11 and Figures E and G contain data with foreign tax credits treated as items which reduce U.S. income tax liabilities. In Tables 2, 4, 6, 8, 10, and 12 and Figures F and H, foreign tax credits are treated as part of the individual's income tax liability.

Implicit Tax

Income from certain tax-preferred sources is either not subject to any Federal individual income tax or benefits from reduced tax rates or the deferral of taxation, or both. However, to the extent that the income from such sources has been reduced because of the existence of tax preferences, the stated tax on such income understates the amount of tax effectively paid by the recipient of that income. In addition to any income tax actually paid, there is an "implicit tax" equal to the amount by which the income from that source has been reduced because of the tax preferences. Thus, the benefit to the recipient of tax-prefer-

red income is less than the stated tax preference to the extent that the gross income from that source already anticipates the tax preference. As a result, an individual may be indifferent between a lower-yield, nontaxable income source and a higher-yield taxable source.

Tax-exempt income from State and local Government bonds provides the clearest example of an "implicit tax." Because of the tax exemption, the interest rate on tax-exempt bonds is generally lower than the interest on taxable bonds with equivalent risk. The yields between tax-exempt and taxable bonds generally differ by an amount such that the yield on the tax-exempt bonds will be about the same or slightly more than the after-tax yield on an equivalent taxable bond. In reality, the holders of tax-exempt bonds are paying an "implicit tax" which is equal to the spread between the interest rates on the tax-free bond and the equivalent taxable bond.

The main difference between implicit tax and ordinary Federal income tax is the recipient of the tax revenue. The general fund of the Federal Government receives the ordinary Federal income tax revenue whereas the implicit-tax revenue is usually divided between the payer and the recipient of the tax-preferred income. The government entity issuing a tax-exempt bond receives part of the implicit tax in the form of reduced rates on interest paid on those bonds. For other assets producing tax-preferred income, some of the implicit tax is received by the seller of the asset in the form of a higher price reflecting the capitalized value of some of the stream of tax benefits.

No attempts have been made in this article to measure implicit taxes. Accordingly, taxes paid and tax rates have not been adjusted to reflect implicit taxes on tax preference income.

Adjusting Income for Implicit Tax

It should also be noted that compared with income from other sources, the gross income from tax-preferred sources is understated by the amount by which that income has been reduced by the portion of the above-mentioned "implicit tax" which benefits the recipient of the income. Thus, in theory, when measuring income, it would be appropriate to "gross up" the amount of tax-preferred income received by the portion of the implicit tax on that income which has actually benefitted the recipient of the income. Since no attempt has been made to measure implicit taxes for this article, incomes have not been increased to reflect the value of implicit taxes.

Comparing Exclusions, Deductions, Tax Credits, and Special Tax Computations

In order to compare the importance of various exclusions, deductions, tax credits, and special tax computations (such

as the alternative minimum tax on tax preferences and the income averaging tax computation), the different types of items must be put on the same basis. One way of doing so is to calculate the size of the deduction that would reduce (or increase) income tax by the same amount as a tax credit. This amount is called the "deduction equivalent" of the tax credit.

The deduction equivalent of a tax credit or a special tax computation is the difference between the taxable income that, using ordinary tax rate schedules, would yield the actual tax before the provision in question is considered and the actual tax after the provision. For example, the "deduction equivalent of all tax credits" is equal to the difference between "taxable income which would yield tax before credits" and "taxable income which would yield tax after credits."

Using this method of equating the value of deductions, exclusions, credits, and special tax computations, the order in which the various credits and special tax computations are calculated affects the value of their deduction equivalents. Because the tax rate schedules are progressive with successive increments to income taxed at successively higher tax rates, the deduction equivalent of the credit converted last to a deduction equivalent will be larger (for the same amount of a credit) than the item converted first.

The deduction equivalents of tax credits shown in the accompanying tables were computed by assuming that deductions and exclusions reduced taxes before tax credits. As a result, the deduction equivalent of tax credits is biased upwards.

Share of Income Subject to Tax

The total impact of various deductions, exclusions, tax credits, and special tax computations can be measured only if the aggregate value of all of, or groups of, these items in reducing, or increasing, income taxes is put on a comparable basis. Two often-used measures of the value of deductions and exclusions are (1) the share of income that has been excluded from tax and (2) the share of income that remains subject to tax. The latter measure can also include the impact of tax credits and special tax computations if the deduction equivalent of these items is added to taxable

income defined in the ordinary manner. Doing so yields what the tables accompanying this article call "taxable income which would yield income tax before credits," "taxable income which would yield income tax after credits," and "taxable income which would yield total income tax." These measures could be computed directly from taxable income and from the deduction equivalents of the appropriate items. However, these measures have been computed by using the tax rate schedules to calculate the amounts of taxable income that would have been necessary (when subject to tax under the appropriate, ordinary tax rate schedule) to yield the given amounts of tax.

Unaudited Data

Tax return data used in the Statistics of Income program have been tabulated as they have been reported on tax returns filed with the Internal Revenue Service. Certain obvious arithmetic errors have been corrected, and certain adjustments have been made to achieve consistent statistical definitions. Otherwise, the data have not been altered. In particular, the data do not reflect any changes that may have been made or that are likely to be made in the future as a result of IRS audits. While this is true of data throughout the entire SOI program, it is of particular relevance for high-income tax returns. Because of the greater complexity of these returns, there is a higher probability of error and more scope for disagreement about the proper interpretation of tax laws.

The fact that the data have been drawn from unaudited returns is of even greater importance for those high-income returns that are nontaxable. Almost any audit changes would make such returns taxable. Even where the tax consequences were minor, such returns would be reclassified from nontaxable to taxable, thereby changing the counts of nontaxable returns.

NOTE TO APPENDIX B

- [B1] Certain amounts of income earned abroad are excluded from adjusted gross income by statute. Any foreign taxes paid on such income are not creditable against U.S. income taxes. The tables in this article do not reflect either the amounts of income excluded or the foreign tax payments on them.

Table 1 — Returns With and Without Total Income Tax: Number of Returns Classified by Size of Income Under Alternative Concepts
 (All figures are estimates based on samples)

Size of income under alternative concepts	Size of adjusted gross income				
	Total	Under \$50,000	\$50,000 under \$100,000	\$100,000 under \$200,000	\$200,000 or more
	(1)	(2)	(3)	(4)	(5)
All Returns					
Total	99,438,708	92,726,609	5,707,146	761,193	243,760
Size of expanded income
